About Kore Potash's Projects

Kore Potash is an advanced stage mineral exploration and development company whose primary asset is 97%-owned interest in the Sintoukola project, a potash project located in the Republic of Congo. The Sintoukola project comprises the Dougou Extension sylvinitic Deposit, the Kola sylvinitic and carnallite Deposits, and the Dougou carnallite Deposit. These deposits are within the Dougou and Kola Mining Licenses. The Sintoukola project also includes the Sintoukola 2 Exploration License.

Sintoukola is located approximately 80 km to the north of the city of Pointe Noire which has a major port facility, and within 30 km of the Atlantic coast. Sintoukola has the potential to be among the world's lowest-cost potash producers and its location near the coast offers a transport cost advantage to global fertilizer markets.

The Dougou Extension sylvinitic Deposit contains a total sylvinitic Mineral Resource Estimate of 145 Mt grading 39.7% KCl, hosted by two seams. The results of a Pre- Feasibility Study ("PFS") were announced on 13 May 2020, which determined Ore Reserves of 17.7 Mt with an average grade of 41.7% KCl. Dougou Extension is located 15 km southwest of Kola. The deposit is open laterally; an Exploration Target for the northward extension of sylvinitic was announced on the 21 November 2018.

The Kola sylvinite Deposit has a Measured and Indicated sylvinite Mineral Resource Estimate of 508 million tonnes grading 35.4% KCl. The results of a Definitive Feasibility Study ("DFS") were announced on 29 January 2019, which determined Ore Reserves of 152 Mt with an average grade of 32.5% KCl. The deposit is open laterally; an Exploration Target for the Southward extension of sylvinite was announced on the 21 November 2018.

The Dougou Extension and Kola sylvinite Deposits are considered high grade relative to most potash deposits globally and have the advantage of having very low content of insoluble material, less than 0.3% which provides a further processing advantage.
